## TOXICOLOGY REPORT

### SPECIMEN RECEIPT

Received in Toxicology: 07:45 09/12/2025  
 Seals Intact: Yes  
 C-O-C Maintained: Yes

### SPECIMEN DETAILS

Specimen Type: Hair  
 Site of collection: Head  
 Length: 35 cm  
 Colour: Dark brown  
 Any special features: Nil

### SEGMENT ANALYSED

Number: 1 of 1  
 Length: 3 cm  
 Weight: 20 mg  
 Relation to skin: Adjacent

DRUGS DETECTED* IN HAIR	RESULT (pg/mg)	LLOR** (pg/mg)
Methamphetamine	5000	50
Amphetamine	430	40

\*Method of Analysis: LC-MS/MS, \*\*Lower Limit of Reporting(LLOR).  
 Test Method accredited to ISO 15189:2012  
 Visit [www.qml.com.au/hairdruglist.aspx](http://www.qml.com.au/hairdruglist.aspx) for information.

### COMMENT

Assuming an average rate of hair growth of approximately 10 mm per month and three weeks for hair to grow from the base of the hair follicle to a sufficient length above the skin to be reliably collected, the time period represented by this hair test extends back to approximately mid August of 2025. Because substances may be incorporated into existing hair through sweat or other secretions, the time period may extend up to and including the date of sample collection.

A moderate amount of methamphetamine was detected, along with a small

amount of its metabolite, amphetamine. This suggests exposure to methamphetamine. The exposure could result from direct use, contamination of the subject's hair through contact with the substance in their environment, or contamination by secretions from a close associate using the substance. The levels present indicate that direct use is the most probable but this test cannot exclude alternative sources of the substance's presence.

No other substances included in our routine test panel were detected.  
Dr Julia Chang
